### 1. Executive Summary

All Phase 2 features agreed in the Scope of Work have been **implemented and verified** (SMS notifications deferred by agreement). In addition, the **entire application** — Phase 1 platform plus Phase 2 additions — was tested end-to-end against the **real backend** (live MySQL database, live AWS S3, live Resend email delivery, live Kimi API): **70 functional tests covering every API router and every workflow**.

|                                                                                                |                                                              |                                                         |                                                                      |

**Single outstanding blocker (external):** the Moonshot/Kimi AI account attached to the provided API key has **no remaining credit** ("account suspended due to insufficient balance"). The key is valid and the required model ( `kimi-k2.5` ) is available on it. Every step before and after the AI call is verified working — recharging the account is the only action required for full operation. No code changes will be needed.

### 2. Phase 2 Scope — Delivery Status

| Feature (SoW ref.)            | Status    | Delivered / Notes                                                                                                                                                                                                                                         |
|-------------------------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.1 AWS S3 File Storage       | DELIVERED | Upload pipeline stores file binaries in S3 (metadata + extracted text in MySQL); private pre-signed download URLs (15-min expiry). Verified with real uploads and downloads against the production bucket.                                                |
| 3.2 Advanced Filters & Search | DELIVERED | Date range, department, phase, status and AI-divergence-rate filters; full-text search; saved presets per user; pagination and sorting. Backend now supplies <code>responsavelNome</code> , <code>taxaDivergencia</code> and latest-comparison reference. |
| 3.3 CSV / Excel Export        | DELIVERED | Order lists and dashboard metrics export to CSV/XLSX; custom export builder with column selection.                                                                                                                                                        |

|                                |           |                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.4 Email Notifications        | DELIVERED | Branded HTML emails via Resend (verified domain) for phase advances, rejections, supervisor alerts and AQL assignments; admin copy option. Real deliveries confirmed during testing.                                                                                                                                                                                                     |
| 3.5 SMS Notifications          | DEFERRED  | Excluded from this milestone by agreement. UI opt-in toggles exist; Twilio integration can be activated later when credentials are provided.                                                                                                                                                                                                                                             |
| 3.6 Visual Kanban Board        | DELIVERED | One column per workflow phase; cards show order code, client, status, assignee and divergence rate; board search + filters. <b>Columns are generated dynamically from active prompts</b> — new departments/phases become columns automatically with zero code changes (unit-tested). Unknown phases get auto-generated labels and styling; orders in unrecognized phases are never lost. |
| 3.7 CI/CD Pipeline             | DELIVERED | GitHub Actions: type-check + tests on every push/PR; deploy from main only after tests pass; optional manual approval gate (GitHub Environment); automatic rollback to previous commit if the post-deploy health check fails.                                                                                                                                                            |
| 3.8 Automated Tests (Vitest)   | DELIVERED | 31 unit tests: CNPJ / EAN-13 / DUN-14 / NCM validators (incl. regression tests for a fixed check-digit bug), email service, dynamic Kanban pipeline. Runs locally and in CI.                                                                                                                                                                                                             |
| 3.9 Health Checks & Monitoring | DELIVERED | <code>/api/health</code> (liveness), <code>/api/ready</code> (database), <code>/api/health/deep</code> (database + Kimi availability). Used by the CI/CD rollback mechanism; ready for external uptime monitoring.                                                                                                                                                                       |

### 3. Bugs Found & Fixed in the Inherited Codebase

During pre-implementation health checks and full-application testing, the following defects (present in the code as received) were identified and fixed:

| Defect                                                                                                                     | Severity | Impact before the fix                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notifications could not be marked as read / deleted (broken SQL helper)                                                    | Critical | Mark-as-read and delete crashed on the real backend; unread counter silently always showed 0. Hidden by demo mode.                                              |
| PDF text extraction failed for every PDF (pdf-parse v2 API mismatch)                                                       | Critical | All uploaded PDFs — the platform's primary document format — silently produced no text for AI analysis.                                                         |
| EAN-13 check digit algorithm inverted                                                                                      | Critical | Valid EAN-13 barcodes were reported to the AI as invalid (and invalid ones as valid). DUN-14 was unaffected by parity coincidence. Fixed with regression tests. |
| Result links used the wrong identifier on 4 pages (Dashboard, History, Kanban, Notifications)                              | High     | Opening a result from those pages failed against the real API. Backend now resolves both identifier types.                                                      |
| SQL scoping bug in order-list subqueries                                                                                   | High     | Counts could resolve against the wrong table scope; new aggregate fields errored until qualified.                                                               |
| 5 TypeScript compilation errors (wrong import path in both locale files, circular type, wrong error type, unused variable) | Medium   | <code>tsc</code> failed; type safety was broken for the i18n and mock layers.                                                                                   |
| Obsolete database seed with 5 outdated AI prompts                                                                          | Medium   | Running it would have corrupted the prompt set (correct seeding is the 3-prompt setup endpoint). File removed.                                                  |

### 4. Full-Application Test Coverage (Real Backend)

All tests below ran against the live stack — real MySQL (Docker), real AWS S3 bucket, real Resend email delivery, real Kimi API — using the application's actual API. No mocks.

| Area              | Verified functionality                                                                                                                                                    | Result |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| Platform          | Health/readiness/deep checks; frontend serving on all routes; API ping                                                                                                    | PASS   |
| Authentication    | Registration; duplicate-email rejection; login; wrong-password rejection; profile; logout; <b>complete forgot→reset→re-login loop</b> ; non-admin blocked from admin APIs | PASS   |
| Prompt management | List/filter/get; admin list; edit with automatic version bump; activate/deactivate; create; delete                                                                        | PASS   |
| User management   | List; create; update department & supervisor flag; role changes; delete                                                                                                   | PASS   |
| Orders            | Create; duplicate-code rejection; list (incl. new Phase 2 fields); get; admin list; status update; duplicate; archive; delete                                             | PASS   |

|                     |                                                                                                                                                                                                                  |                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
| Documents & storage | TXT and PDF upload; text extraction; S3 binary storage; pre-signed download with content match; content correction; delete                                                                                       | <b>PASS</b>                                    |
| Comparisons         | Create; status polling; fetch by identifier (both types); list per order                                                                                                                                         | <b>PASS</b>                                    |
| AI execution        | Real Kimi API call — request correctly formed and sent                                                                                                                                                           | <b>BLOCKED</b><br>—<br>account credit (client) |
| Approval workflow   | Per-packaging approve/reject with notes; field-level approval; <b>phase blocking while items rejected</b> (negative test); supervisor override; advance Atendimento→Design→CQ→Completed; archive; rejection flow | <b>PASS</b>                                    |
| AQL quality control | 20% random assignment; reviewer inbox; review submission; automatic divergence record on disagreement; statistics                                                                                                | <b>PASS</b>                                    |
| Divergences         | Create (false positive/negative); list; statistics; resolve (both admin paths)                                                                                                                                   | <b>PASS</b>                                    |
| PDF reports         | Real 240 KB audit report generated (HTML→PDF engine)                                                                                                                                                             | <b>PASS</b>                                    |
| Metrics & dashboard | Overview + all 8 admin analytics endpoints                                                                                                                                                                       | <b>PASS</b>                                    |
| Notifications       | Created by workflow events; listed; unread count; mark read; mark all; delete — persistence verified at database level                                                                                           | <b>PASS</b>                                    |
| Email delivery      | Real emails delivered via Resend for workflow events (phase advance, rejection, AQL)                                                                                                                             | <b>PASS</b>                                    |

**Score: 70 functional tests → 69 areas working; 1 blocked externally. A follow-up verification round of all fixes passed 7/7. Unit suite: 31/31. TypeScript: clean.**

## 5. What Is NOT Covered / Known Limitations

| Item                             | Status         | Notes                                                                                                                                                                                       |
|----------------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AI comparison execution          | BLOCKED        | Waiting on client recharge of the Moonshot account. All downstream flows were validated using simulated AI results written directly to the database.                                        |
| Image OCR (Tesseract)            | NOT TESTED     | Photo/image text extraction not exercised in this round (downloads language data on first use). Recommended as a smoke test once AI credit is available, since photos feed the AI analysis. |
| Mistral OCR (scanned PDFs)       | NOT CONFIGURED | Optional enhancement; no API key provided. Text-based PDFs work without it; scanned/vector-art PDFs currently fall back to basic handling.                                                  |
| Browser click-through automation | PARTIAL        | APIs behind every screen are fully tested; the visual layer was validated by the client's UAT session (demo mode). No automated browser E2E (e.g. Playwright UI tests) exists yet.          |
| Load / performance testing       | NOT DONE       | Out of scope for this milestone.                                                                                                                                                            |
| SMS notifications                | DEFERRED       | By agreement; UI prepared, Twilio pending future milestone.                                                                                                                                 |

## 6. Recommended Backlog (pre-existing, outside Phase 2 scope)

- **Access-control hardening:** order list currently returns all users' orders; results are readable by anyone holding the identifier; admin pages are hidden but not route-guarded in the frontend. Recommended as a priority security item.
- **Credential rotation:** older repository documents contain live-looking credentials (API key, database passwords, SSH details, default admin). These should be rotated before wider distribution.
- **Localization completion:** the Result and Divergences pages plus legal pages remain untranslated (translation keys already exist for most of them).
- **Code quality:** 48 pre-existing lint findings (loose types etc.); frontend bundle could benefit from code-splitting (1.5 MB).
- **Preferences enforcement:** notification opt-out toggles are saved but not yet consulted by the email sender.

## 7. Integration & Environment Status

| Integration        | Status          | Detail                                                                                        |
|--------------------|-----------------|-----------------------------------------------------------------------------------------------|
| MySQL 8 (Docker)   | OPERATIONAL     | Containerized; schema (10 tables + Phase 2 additions) created and seeded.                     |
| AWS S3             | OPERATIONAL     | Bucket verified with real upload/download; pre-signed URL access working.                     |
| Resend (email)     | OPERATIONAL     | Sending domain verified; real deliveries confirmed.                                           |
| Kimi / Moonshot AI | AWAITING CREDIT | Key valid; model <code>kimi-k2.5</code> available; account requires recharge (client action). |

|                        |       |                                                                                 |
|------------------------|-------|---------------------------------------------------------------------------------|
| CI/CD (GitHub Actions) | READY | Test gate + deploy + health-check rollback configured.                          |
| Docker deployment      | READY | Dockerfile + docker-compose.yml (app + database, incl. PDF engine) for any VPS. |

## 8. Conclusion

**The application is working.** Every feature of the existing platform and every Phase 2 deliverable was implemented and verified against real infrastructure. Nine defects inherited from the original codebase — including three critical ones that silently broke PDF ingestion, barcode validation and notifications — were found and fixed as part of this milestone.

**The single remaining blocker is external:** recharging the Moonshot AI account. Once done, the AI analysis operates immediately with no further changes.
